

Exp 1a : Static Hosting

a) Hosting of a PHP file on Local virtual machine using Xampp

1. Create a .php file in some local repository

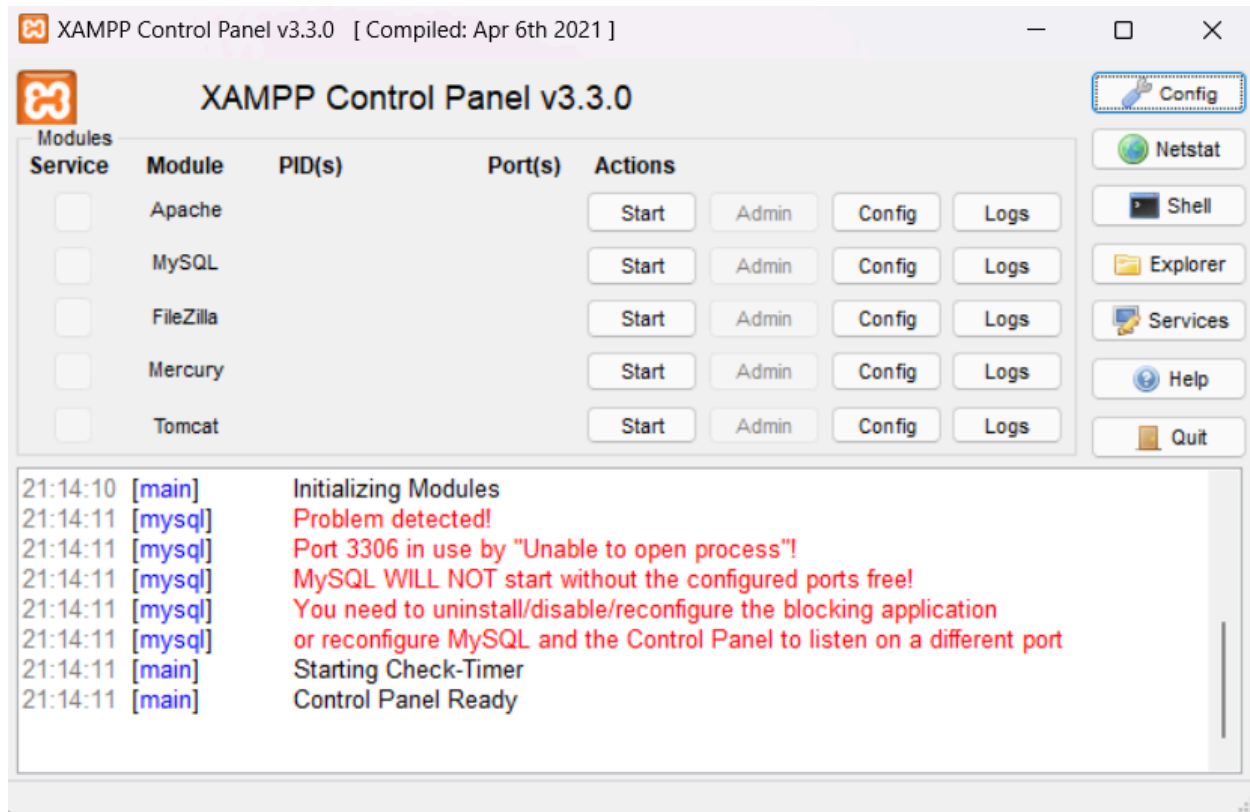

2. Make changes in that .php file as per your desire and save it

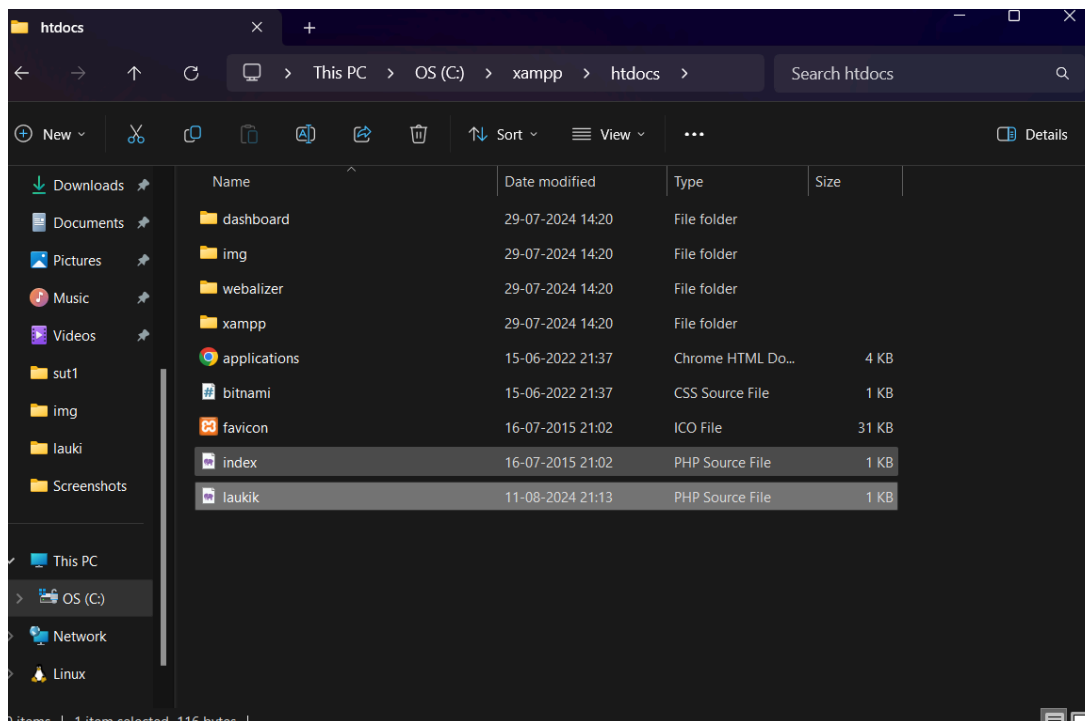

A screenshot of a code editor window with a dark theme. The title bar shows 'laukik.php'. The menu bar includes 'File', 'Edit', and 'View'. The code content is as follows:

```
<html>
<head>
    <title>First PHP Program</title>
</head>
<body>
<?php
echo "I am laukik";
?>
</body>
</html?|
```

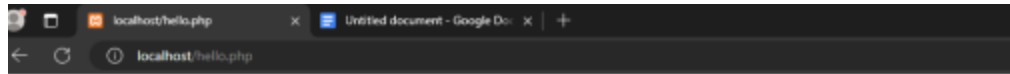

3. Make sure you have installed Xampp on your local machine. After the installation, start Xampp control panel and start modules named Apache and MySql

4. Ensure that you relocate your .php file in the htdocs folder inside the Xampp folder

5. Access the contents of the php file by typing localhost/your_file.php on your browser. We have successfully hosted our php file on our local machine using Xampp.

My first PHP page

Hello World!
